

"Shapefile has error. Unable to open" error interferes with current AGWA processing.

Posted by isburns - 2007/11/03 23:04

This error can occur when AGWA deletes temporary files from the working directory that are still present in a view or in the Table view. First, make sure that all data sources for themes within the view are still available (to see the pathname for a theme, go to Theme>Properties). If the data source is no longer available, remove the theme and its attribute table from the project. Save the project and close ArcView. The error should be resolved when ArcView reloads the project.
